Personal Portfolio

CONTENT MANAGEMENT SYSTEM (CMS)

For this particular project, my personal portfolio site is a Content Management System (CMS) I built myself from the ground up using PHP.

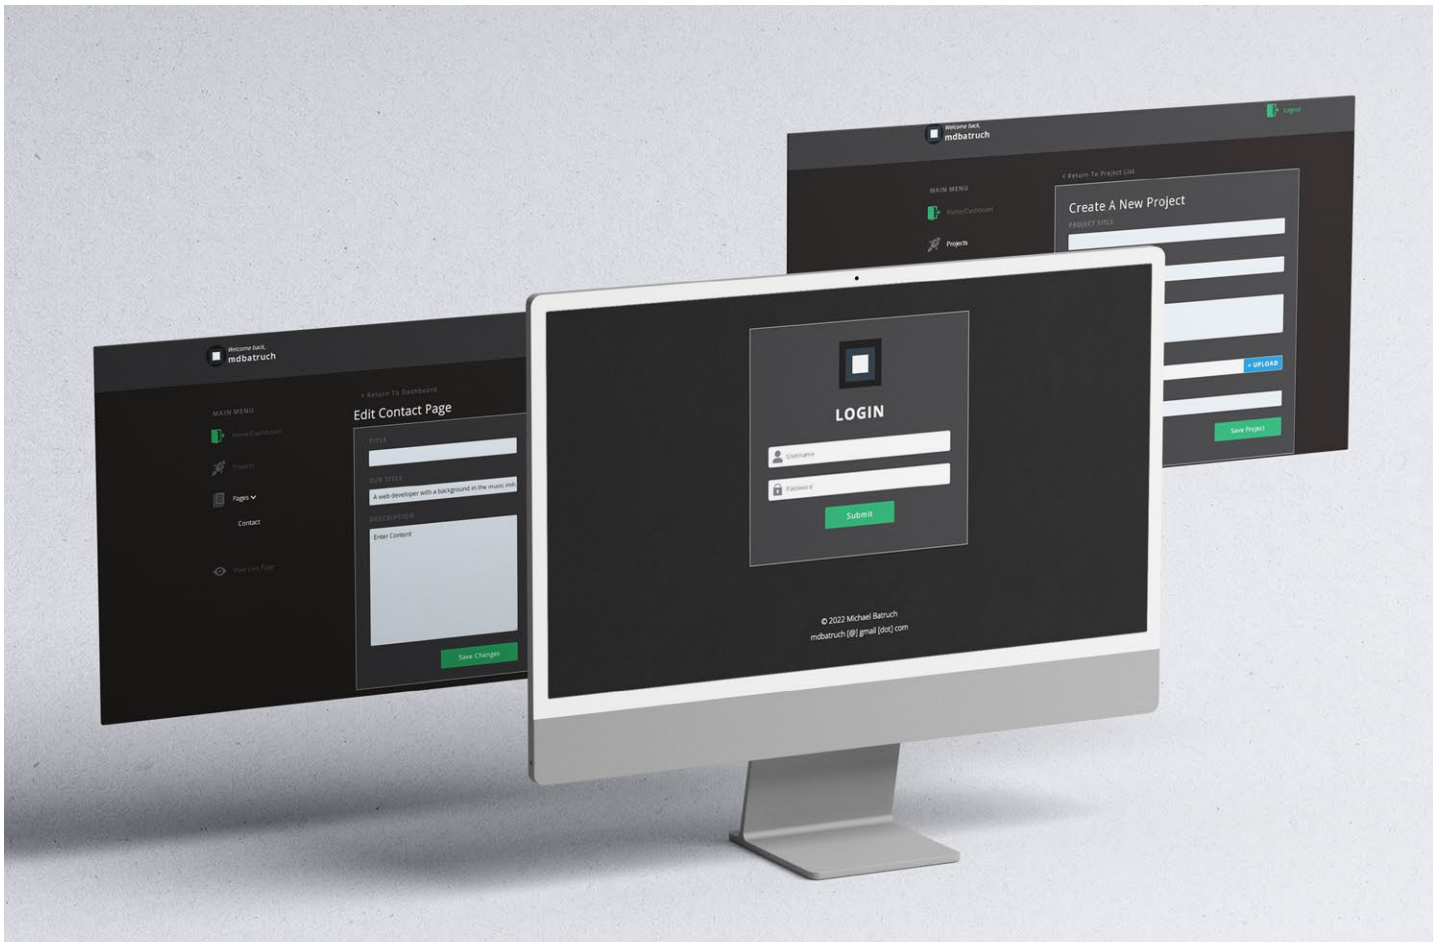

As such, the admin side cannot be displayed for security reasons but I've included a few screenshots detailing the pages there that go beyond the pages you see when visiting this particular site.

The entire site is managed by an account that I created, which allows me to upload new projects to the homepage; which include titles, links, images, alt tags, and a brief description of what the project entails. Along with it, there are options to update, toggle an active/inactive display or remove the project entirely from both the front of the site and admin as well. Other features include toggling the project list layout in the admin side to allow me to view the projects side by side or one per row as I'm managing them.

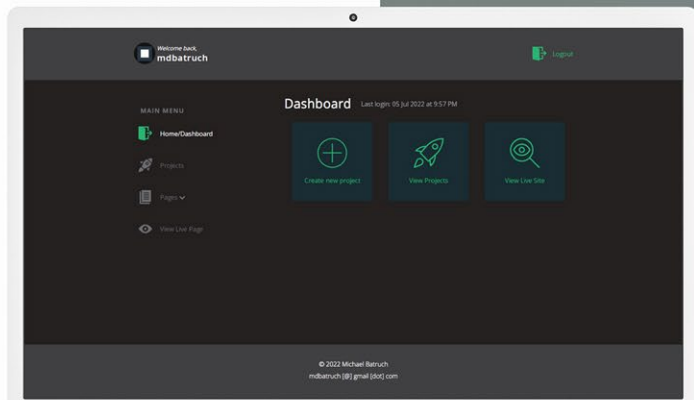

Once you login, you are directed the dashboard, which includes a few options such as view the entire project list, creating a new project to add to the list, editing existing pages, returning to the homepage and of course; logging out finally.

Using jQuery and AJAX, this allows me to validate form inputs before they are sent to and submitted to the database using prepared statements with mysql server side.

The Contact page content is managed as well from the admin and the contact form itself is vetted and validated through Google reCaptcha before submitting via PHPMailer.

The site itself is fully responsive, with a toggling mobile menu and adheres to even some of the smallest phone sizes. This is included on both the front end and admin sides of the application, allowing me to update the website on the go off my phone as I feel fit to, instead of relying to login from a laptop or other non mobile device.
